

# HOW GREEN IS A REAL CHRISTMAS TREE?

Real Christmas trees are a sustainable crop, biodegradable, recyclable and produced in America by our working class... Fake trees are petroleum based, they don't breakdown and are produced in far away places where the environment is not a consideration, eventually ending up in our landfills here in our country.

*A traditional pleasure that protects the planet and keeps our jobs here!*

## NATURAL CHRISTMAS TREES...

- *A sustainable crop planted by our farmers and grown in America*
- *Free from PVC, Mercury and other dangerous chemicals found in artificial trees*
- *Christmas trees trap carbon dioxide and store it through their growing lives*
- *Christmas tree crops make marginal farm-lands useful, they stabilize soil, protect the water table and create habitat for wildlife*
- *Many avenues exist for the eco-responsible disposal of real trees, simply contact your local municipal authorities to know more*
